

POWER-GEN Europe 21 - 23 June, 2016 Milano http://www.powergeneurope.com/en_GB/index.html

Although this important event will take place in Italy, I would not attend for two reasons.

- 1) As a private citizen I do not have two thousand Euros to spend.
- 2) If anyone, public or private, had appreciated my presence, he would have invited and sponsored. Instead, nobody reacted to launch on the network of my hydroelectric solutions.

However, my small presence will be equally cumbersome in this conference because the speakers will have to do their homework to answer the following questions they ask my solutions.

1) is possible or not possible produce energy by using only the energy of position of surface water by means of combining pumps and turbines?

1) is possible or not possible get around the gravitational force by means of dual supply pumps on the suction side. In this case, if the first hypothesis is true. is possible also generate energy by raising the water and floating versions pressurized with compressed air?

These solutions are based on simple reasoning that until now nobody has been able or willing to disprove scientifically. But this conference has the duty to clarify why the current hydroelectric is the hydroelectric of powerful that live of large contracts and in many cases, damage the environment. This type of hydropower has no reason to exist because almost all hydraulic jumps were exploited. Now is the time of submerged hydropower that would bring oxygen into the polluted waters and that could also lift the nutrients and carbonates from oceanic plains to cool the planet, producing natural fish supply to the population that will grow over nine billion people. But it is also the hydropower of small and medium-sized enterprises which will carry out in urban condos along purifying water and air with artificial rains, it was in vertical limestone and mini greenhouses. But it is also the time of of hydropower pressurized, which produces energy, always with the combination of the dual supply pumps and turbines, consuming only the energy to restore the percentage of air that solubilizes in the water and energy for the recycling water. The water is not compressible and does not need to be raised to produce electrical energy, if it has an energy of natural or artificial position to exploit. The water always retains the shape of the reservoir that contains it also while is used to produce energy in the turbine, because the large natural or artificial hydrostatic pressure can not oppose to the small residual kinetic energy that comes out from the turbine. These simple considerations it seems that the existing hydropower producers have not made. We ordinary citizens do not know if they did it or not have done. If they continue to keep quiet we'll never know. I personally, waiting for some answers, I prefer my hydroelectricity. Their energy we know, has already given all he could give, for better or for worse. Mine is the energy of hope on which no one has invested one-euro cent, including the main sponsor of this event, which is the Ministry of Italian Economic Development. What economic development we can have if the world does not finance prototypes of inventions public utility from a few thousand euro, based on global environmental protection principles, while bringing forward monumental works by billions of euro, as the Moses of Venice, that address specific and local problems, regardless of the reasons for which the waters are becoming higher and regardless even of small inventions like the dual supply pumps that would allow at least to save the expenses for the defense of the territory, although did not produce energy simultaneously, as for myself is this possible? I will not go to this conference but the answers I aspect too, but I will continue also look for alternative answers because I do not trust people who do not respond spontaneously on public interest issues.
