

# **The G20s and COP26,27... cannot understand what science has not yet understood.**

## **Abstract.**

Global warming has been produced legally because the controllers and controlled in the current development model are on the same side. World governments have gradually stopped being entrepreneurs and even if they do scientific research, they sell patents to multinationals. Obviously, multinationals work to create profit for investors and do not buy utility patents that are not commercial. These, above all, should be developed by public research, if intellectual property is recognized and rewarded. This, unlike the industrial one, should not have national borders. Therefore, public utility inventions should not pay maintenance taxes in all countries that make them. However, countries that would appreciate and use them should give the inventor country a reward for the use of this invention, of which a percentage would go to the inventors. Unfortunately, these rules don't exist. Even if the acronym of WIPO, which is a United Nations body, means World, Intellectual, Property, no world organization rewards intellectual property, if it is not associated with industrial property. The consequences of this worldwide legislative shortage are very serious because neither public inventors nor private individuals are stimulated to produce inventions that do not produce any income from work. Inventions of public utility are not just those that help the disabled. They are also and above all the interactive energy and purification solutions, which are very different from those we pay through the bills of the municipalities and fuel distributors. In fact, we pay for inefficient public services and fuels that produce more harm than good to humanity because by exploiting single scientific principles, they are unable to close all the

chemical cycles they open. While nature manages to do this with natural cycles such as photosynthesis, biochemistry, organic and inorganic chemistry, and the time required due to the quantities of the elements to be neutralized, the ambient temperatures and the operating pressure which is the atmospheric one, in some hydrostatic case. Nature has never separated the purification cycles of water and air. Instead, science, entrepreneurs, artisans, having specialized in individual tasks, have organized the work differently. On planet Earth, those who purify water do not purify the air, those who produce energy use different systems: thermal, nuclear, electrolytic, solar, wind, without worrying about the side effects, which above all, in the first three cases, produce alterations to the surrounding environment. Nobody realized that it would have been more logical to cover the purification plants and increase the pressures, or at least avoid the dispersion of polluted air to carry out complete cycles of water and air, exploiting the permeability of gases in the water legislated by Henry and Dalton. The undersigned has noticed this, having worked for seventeen years as a designer and installer of industrial plants. Then, for 20 years, as a designer and installer of environmental and water lifting systems. He invented the covered purifiers, which strangely have collected the world silence. World science, which works in watertight compartments, far from the organization of the industrial work of production machines and from the production of hydrogen sulphide in the sewers, has not been able to understand the need to create complete systems that do not disperse anything in the external environment, creating deep purification pits along the sewer paths, such as Imhoff, which exploit anaerobic purification in the lower area and aerobic purification in the upper area. It is no coincidence that the current sewage systems produce hydrogen sulphide and septic water and force the final purifiers to consume immense energy, which instead of exploiting Henry's principle which would work for free by statically pressurizing the water in autoclaves, use

diffusers. of air that waste an immense amount of energy. It is no coincidence that public purification and energy plants are completely wrong and nobody corrects them all over the world. To purify the combustion fumes, the best way was and is to create artificial rains in limestone greenhouses in the subsoil or covered, after capturing the fumes in modified chimneys. This is an interactive system, not only because it purifies water and air together, but also because it sends water that has already been purified and alkalized to the lakes and seas that are becoming acidified. We must ask ourselves the reasons why world public science has kept silent about these solutions patented by the undersigned also at an international level, in the now distant 2012, while it has continued to sell its patents to multinationals. We must ask ourselves why the environmental laws are lacking and no one corrects them, while all the sustainable inventions of the undersigned no one comments on them, as if they did not exist. Billionaire Elon Musk even enjoyed promising \$ 100 million to anyone who solved the CO2 capture problem at the beginning of the year 2021, without knowing that the problem had already been solved in 2012 but no institution and no patron did it. funded: Did not respond to my following open letter. 01.02. 2021

<https://www.spawhe.eu/open-letter-to-mr-elon-musk-who-promised-100-million-dollars-to-those-who-manage-to-capture-co2-from-the-atmosphere/>.

### **Description.**

In the actual global context and with the environmental legislative vacuum that does not recognize the usefulness of interactive principles, both for purification and for sustainable energy, it is obvious that multinationals only buy patents that increase their profit, not those that make save resources.

It is no coincidence that none of SPAWHE's inventions have been tested and implemented because together they represent an

alternative development model to the power of world capitalism of incompetent governments and profit-hungry multinationals. The interactivity of industrial energy and purification processes cannot be achieved by science that works in public and private watertight compartments. It needs modifications to the machines and systems. It is no coincidence that public and private science is silent on global linear motors that could add together the thrust of Newton and Lorentz to exit the atmosphere, not by challenging gravitational force, but by exploiting it in favor of processes through Newton's thrust and producing primary hydroelectromagnetic energy that moves permanent magnets in an electric field consisting of solenoids that surround the primary energy plant without producing heat, which would prevent the Lorentz force from being produced. In fact, this on planet Earth can only be produced at the temperatures of the terrestrial environment. The only acceptable heating is that due to the resistance of the electric wires according to Ohm's law. While the current thrusters, at very high temperatures that NASA and space and aeronautical entities use, are not able to add up the thrust of Newton and Lorentz because the latter can only be produced with copper wire coils protected by insulating paints, not compatible with the temperatures of rockets, nuclear reactors and thermal turboprops. This cold-produced energy is no less powerful because compressed air can reach pressures of thousands of bars, if earth temperatures are maintained. Therefore this energy, not only is the cheapest, it is also the only one that is not consumed because the air that escapes from the vents made at atmospheric pressure will be recompressed and inserted back into the autoclaves that produce the primary energy, while the incompressible water which constitutes the energy carrier, simply does not consume and is constantly oxygenated by the air up to the maximum saturation of nitrogen and oxygen. Obviously, the way to fly in space can also be used on Earth with zero energy costs, but only in terms of material wear. Isn't it ridiculous to think that we are powerless in the face of the fires that are

destroying all the world's forests and savannas because we have the wrong way to fly? In fact, only by adding together the thrust of Newton and Lorentz by adjusting the revolutions of the motors that move the permanent magnets and those that signal the production of compressed hydroelectromagnetic primary energy, can we stay on the outbreaks of fires for the time necessary to put them out. The current Canadaair only waste resources by increasing pollution. World science is silent on these topics which are still zero funding, while the current distribution of world wealth, the scientific ignorance of politicians and of science itself on the potential of interactive systems, prevents governments from scientifically governing by updating the state of the art in all areas of human activities. Political or world economic choices should be stopped immediately if first men do not learn to design terrestrial anthropogenic plants by closing all the cycles that open, or avoid opening cycles that fail to close, or learn to trigger energy principles and interactive physical purifiers, which are latent but cannot intervene, if those who design the systems do not know how to trigger them, artificially creating centripetal, centrifugal effects and exploiting the principle of impenetrability of the bodies, which expels the primary fluid dynamic energy for free from the pressurized autoclaves. These fluid dynamic effects that nature has always used are due to the movements of water and air and the presence of gravitational force. These beneficial effects in nature occur spontaneously by creating sea currents, artesian wells, moderate ventilation. Is it possible that world science has not noticed that the beneficial effects are becoming evil in recent years? typhoons, droughts and floods are increasing with a logarithmic curve like the acidification of the oceans and the melting of glaciers. What does it take to understand that this damage is produced by the immense amount of thermal and chemical cycles that we have opened and not closed in the soils and in the earth's atmosphere?

Nobody understands the elementary fluid-dynamic logic described in the SPAWHE system (Synergic Plants, Artificial Welling, Hydroelectromagnetic Energy) because it is an interactive logic, between the compressibility of air, the incompressibility of water and the gravitational force, but it occurs in all the great terrestrial atmospheric phenomena and also occurs in the invisible organic and inorganic molecules present on planet earth, which trigger biological processes, of organic and inorganic chemistry. The current terrestrial fluid dynamics inventions have individually exploited the physical principles of liquids creating hydroelectric energy and fluid dynamics and have individually exploited the physical principles of combustion gases and compressed air with a very limited vision of the real potential, both from the point from an energetic and purifying point of view. The interactive principles connected to the laws of Newton, Henry, Pascal, Venturi, Torricelli, who have never worked together to statically exploit the compressible air pressure and the incompressible water circulation, have been underestimated. In fact, currently, air and gases have been dynamically exploited in cylinders with pistons that absorb and return energy with very low yields, while water has been exploited in a single way to produce energy by falling without its recycling. It is obvious that with such a limited vision of world energy science, with the increase in the energy production we need, we would inevitably have produced disastrous environmental side effects by dispersing the water and combustion fumes of the environment.

Those who demonstrate in the streets against climate change are right against this science, but they do not realize that they cannot expect a quick solution to problems from this ruling class because the concepts of interactive design have never entered world school education. If they had entered, the first to know them would be the young people protesting in the squares. But if they knew the real cause of the problems it is evident that their professors and science in general would

also know about it. Consequently, even the politicians, the economists, the legislators would have adapted. Consequently, global rewelding would not exist. Consequently, they would have no reason to protest.

If elementary interactive logic had been taught, everyone would have understood it, just as the wrong concept of perpetual motion was understood. Science has not taught that the concept of perpetual motion would be valid if we lived in a vacuum. But since we live on Earth and gravitational force exists, wrong things have been taught in schools and we have created a wrong development model because we have not been able to design anthropogenic plants by exploiting the fluid dynamic interactive principles that nature has made available to us also to trigger the terrestrial electromagnetic processes, which also function in a vacuum. Although the fluid dynamics principles have been identified by Newton, Henry, Pascal, Venturi, Torricelli, no one has deepened them up to the present day because those who have conquered power and hold the world wealth have also appropriated energy resources and want to consume them even if they do more harm than good to humanity. Unfortunately, those in power also have the power of disinformation and paid silence simply by triggering the fear of job losses, the collapse of world stock exchanges and the loss of apparent social security.

Who should explain to the young people who protested outside the G20 and outside COP26, where they managed to enter, that today we would not be talking about global warming and Covid 19, if all the anthropogenic plants, fixed and mobile, had already been designed otherwise? That we would all live happily ever after with a model of sustainable world development, which would not produce any kind of pollution, and that we would not have to pay for the energy that is subject to the cost of raw materials, but only the cost of the machines that extract it from environment and maintenance of such machines? Young people cannot believe me who is a simple

pensioner. They rightly want the answers from governments and mainstream science.

After the world wars of the last century and the collapse of the Berlin Wall on November 9, 1989, the planet Earth should have found world peace and harmony, but the seed of capitalism had already taken root because communism was not accompanied by adequate scientific research. The United Nations did not prove to be up to the task, having concentrated above all on political, economic and humanitarian agreements. Instead, they should have been, above all, a set of impartial scientific and technical bodies, to coordinate world development, safeguard the planet's natural resources, help the poorest countries to keep themselves at the same scientific and technological level as others. The United Nations went along with them. The regulations of the WIPO, have taxed the ideas of the inventors before they found the economic funds for the experiments, requiring the payment of deposit and maintenance fees in all countries, without making any distinction between inventions of public utility and commercial inventions. The legalized trade in patents studied by public researchers towards multinationals was the icing on the cake of a wrong development model that prevented sustainable research in directions other than those desired by patent buyers.

How do world politicians and the United Nations Organization, which manages COPs and WIPO, fail to understand that this system cannot work. Indeed, it also encourages public research to work for the profit of multinationals and rewards the worldwide corruption of public bureaucrats, politicians, who hide research and inventions that are not attractive to the only customers who are multinationals. These cannot convert to energies that do not sell or transform raw materials. First they have to amortize all the investments made in the current energies and then they will switch to cleaner energies. Unfortunately, at the point where we are, even clean energies are of little use if they are not sustainable. They cannot be

sustainable if they are not interactive. This world science has not yet understood.

The current world centers of power do not want to implement an alternative development model, but only to improve the performance of the current one so that no one can say that politicians and science are not doing their job correctly. In this global context, there is no place for inventors like myself who propose a completely alternative development model to the current world centers of power that cost nothing to world public and private research. If the undersigned had wanted to experiment and realize all SPAWHE's inventions, it would have taken many decades and probably, the wealth of the richest man in the world would not have been enough. Instead, I paid only the taxes on national deposits and international patents on the cleaning of fossil energy (about 20,000 euros) to realize that it is impossible to find public and private interlocutors willing to correct the current development model. Patent trading and international law have put controllers and controls on the same side. At present, the major countries are trying to delay decarbonization and those who want to do it want to switch to other commercial energies, such as new nuclear power and hydrogen. However, SPAWHE, developing the details globally, although only virtually, has shown that in order for the earth system to function properly, all human activities must be interactive and self-purifying. It is no coincidence that this system does not transform and does not consume the matter that produces the fixed and mobile terrestrial energy. It only borrows it from nature. In fact, nature has created the gravitational force, the compressible air and the incompressible water that with the machines and systems designed differently from the current way, allow to trigger and maintain over time the self-purifying energy processes in all human activities and means. land, sea, aeronautical and space transport. Even the human heart can be replaced with very small self-purifying systems that are autonomous energetically, which could be the first step to

extend the duration of human life, not by months or a few years, but by multiplying the current duration, if yes, it accepts coexistence with prostheses and 'artificial intelligence. We have seen through the Paralympics that you can be happy and efficient even with severe disabilities if you love life and believe in moral values.

I consider myself a lucky person because I loved my work which stimulated me to grow in knowledge, even if I only collected silences. My work as a designer and installer of industrial and environmental anthropic systems has never allowed me to design a complete system. I had to do it as a retiree, at least virtually, because my implants were never built, as they are also misunderstood by science. As an employee I was bound by company directives and public tender specifications, which had already identified the solutions to be implemented, the type of machines to be used. Basically, in the last twenty years my job consisted of competing with competing companies, first to win the job and then I developed it in detail and make it happen. I had to do a market research to win tenders between different suppliers to identify the machines that met the specifications, estimate the costs of the construction and assembly of the complete plant with all the materials, accessories and completion equipment. Obviously, not alone, being solely responsible for the hydraulic, mechanical and process control instrumentation systems. Once I got the job, my job was to develop the executive details, buy the machines and equipment, and try to get back into the budget costs. It is clear that this type of work carried out in industrial and environmental plant engineering does not leave room for imagination and creativity, but allows you to know the details of the machines, work cycles, work organization, and to identify defects and limitations of plants normally contracted out, above all, by world public bodies. These plants, not being constrained like those of industrial production (which I had known in the previous twenty years), do not update the production machines according to the organization of work to

win the competition on the quantity and quality of the product. Therefore, the state of the art of industrial production machines advances at a much faster rate than the state of the art of environmental protection and primary energy production. I think my industrial experience was fundamental to realize the difference. Probably, if I had not added the two experiences, I would not have been able to propose myself as a retired inventor. In fact, the production of energy is closely linked to the advancement of the state of the art of environmental protection. But it is impossible to improve the state of the art of energy production without going into all the details of the environmental systems and without applying the rules of the organization of industrial work to increase energy and purification productivity at the same time. The first step was to unify the water and air purification cycles and this automatically involved changing the chimney stacks, sewage systems and purification plants. All subsequent plant improvements could only come about after taking the first step that the world ruling class never had the courage to take. This is why I was forced to create a website where the inventions and related illustrative publications are published in chronological order so that everyone can understand at least the advancement of the virtual state of the art, since the real one never happened. So, I am forced to publish the SPAWHE.eu nursery rhyme again, to challenge public science and that of multinationals to go into details as I did, despite not having public and private funds and experimental laboratories available. It must be public and private science that takes responsibility for denying the validity of my solutions, not the bureaucrats of the patent offices, not even the politicians who direct the ministries of the environment, economic development and world labor. Only by reading SPAWHE's nursery rhyme, which is a long list of inventions not unanimously tested by science, governments and world entrepreneurs, can one realize that science does not work for the whole of humanity but for those who pay it best.

It seems that science is behaving like politics, not revealing its findings quickly to avoid the collapse of the world stock exchanges. In this timing strategy, probably, the silences can also be framed on the SPAWHE rhyme. But this strategy can no longer be pursued. Science has a duty to speak out immediately because if science continues not to be applied globally, all investments for future development will continue to be wrong. Already today the bulk of future investments will be due to the demolition of the wrong inventions. Especially the gigantic structural, hydraulic, nuclear, thermal works, those that transport gas and oil, those that transport electricity. The whole, current world development has become obsolete. If it does not stop immediately and becomes positively interactive with the terrestrial environment, science will be the most responsible for the complete destruction of the terrestrial biological, zoological, aquatic balances which are fundamentally based on the interactivity of primary fluid dynamics with electromagnetism at terrestrial temperature. . While the equilibria of the universe are based on the interactivity of the thermodynamic primary energy with the same electromagnetism. To save the planet and begin the colonization of the universe we cannot wait for the long times of science that continues to work in watertight compartments, while politicians and economists, clearly, not knowing what to do, continue to spend resources by financing development and works. obsolete.

Here is again SPAWHE's rhyme:

"The cleaning of fossil energy published in spawhe, based, above all on inorganic chemistry that is able to absorb CO<sub>2</sub>, producing carbonates in the water. To speed up the processes and reduce the energy costs that would have involved the circulation of very large quantities of water necessary to neutralize the very large quantities of CO<sub>2</sub> emitted by the current thermal power plants and heat engines, it has gradually been transformed technologically into solutions of

less space by exploiting the principles Pascal and Henry. In fact, I realized that on planet Earth, all the activities that nature produces through organic and inorganic chemistry, photosynthesis and the carbon cycle can be increased in speed without any need to use thermal, nuclear energy and current renewables. It is sufficient only to increase the operating pressures of the systems, modify the circulation pumps and make the machines work differently. In fact, natural interactive systems expel, with the times required by nature, the elements extraneous to natural cycles, due to accidental polluting phenomena, including direct and indirect thermal effects due to volcanic explosions, to natural fires that have always existed on the planet. The current industrial activities of men have multiplied exponentially the elements extraneous to natural cycles, therefore nature is no longer able to restore interactive balances. Obviously, this is my truth and in the entire website, I explain how, in my opinion, we should have created global plants that purify both fumes and water at the same time before they go to pollute the soils, rivers, lakes and seas. Having not done this in any country in the world, it has not been possible to advance the state of the art of purification to make it known to other countries. Therefore, the advancement of the state of the global purification art has not occurred. Consequently, it was not even possible to notice that the water circulation pumps, if we make them work in the direction of gravitational force, by placing them in series with the turbines, we could extract the energy directly from the environment. Having not done this, it was not possible to realize that the water circulation pumps, if in addition to making them pump in the direction of gravitational force, we modify them on the suction side and make them another inlet clearly separated from the main one up to the same impeller, we can always use the same water to create energy because we use one feed to recycle the water from the upper basin and the other feed to introduce into the same impeller the water discharged from a turbine fed by falling water from the same upper basin. Not

having done this, it was not possible to think that by replacing the upper basin with a pressurized autoclave with compressed air, it being understood that we use a turbine connected to the outlet of the autoclave, we can recover the water drained from the turbine and insert it back into the autoclave, whose pressurized water is recycled with the same impeller of the pump by means of the second supply. In this way, with the same water and the same compressed air, we would have produced a current generator that extracts energy from the environment, with quite small dimensions. Having not done this, it was not possible to further reduce the dimensions of this current generator by increasing the operating pressure of the autoclave in order to be able to mount it on cars and trucks, on agricultural tractors. Not having done this, it was not possible to think that the overall dimensions can still be reduced by using submersible pumps as turbines mounted directly in cylindrical tubes that would act as autoclaves. Therefore, these groups could be used to be inserted directly into the wells to raise the water and at the same time oxygenate the aquifers which today are polluted by agricultural fertilizers, herbicides and pesticides and fecal coliforms. In fact, we know that part of the air that pressurizes the autoclave dissolves in the water according to Henry's principle, purifying the water for free. Not having done this, it was not possible to think that the overall dimensions could be reduced even further. Even miniaturized and instead of purifying the water from the wells we could purify the human blood, placing two small autoclaves side by side that would replace the right and left ventricles, creating energetically autonomous artificial hearts that would feed the systemic circuit that oxygenates the brain and the lungs to lengthen the life of the 'man. Having not done this, it was not possible to think that pressurized cylindrical autoclaves can be incorporated an external cylinders containing water at atmospheric pressure, outside of which sliding tracks of permanent magnets mounted on transmission chains driven by motors can be made electric at variable

revolutions that would produce an electromagnetic flux of variable intensity which would produce induced currents in a solenoid outside the same water tank. Therefore, we could produce in this tank a linear electromagnetic thrust force according to Lorentz's law at the ambient temperature, without fuel that could be added to the reaction thrust of Newton that would be produced by propellers driven by electric motors always commanded by generators. of current that produce the primary hydroelectric energy, fed by submersible pumps used as turbines placed inside the central reservoirs. Not having done this, it was not possible to replace the current thermal turbofans of aircraft to travel in the atmosphere and in space with energy extracted directly from the environment, it was not possible to create flying cars, nor submarines that move with the same system without fuel. It was not possible to make the ships travel without fuel, nor to mount the same system to make mobile barriers in the sea to defend ourselves from high waters. It was not even possible to think that in the space travel of the future we can add to the global linear motors an external steel tunnel connected to the turbo fan, where it will produce a higher vacuum higher than the surrounding space vacuum and connect this tunnel with a small vacuum pump to a thickening tank of the captured powders, which will be emptied periodically letting in the atmospheric air which will feed an electrostatic filter that will recover the powders that will be used together with the other interactive purification and energy plant inventions described on the website <https://www.spawhe.eu> to make humans survive even in space without suffering physiological damage due to the absence of atmospheric pressure, gravity, food resources and raw materials to build spare parts for the machines necessary for survival in space. In fact, atmospheric air and water will fill the space caravan wagons full of human beings and will be endlessly recycled, suitably replenished with artificial photosynthesis and carbon cycle, while general gravity will be reinforced, becoming very similar. to the terrestrial one, electrostatically polarizing the paths of

atmospheric conditioned air and recycled water in the interactive, energy and purification, compressed hydroelectromagnetic plants, still unknown to terrestrial science. " Luigi Antonio Pezone

The current Canadair only waste resources by increasing pollution. World science is silent on these topics which are still zero funding, while the current distribution of world wealth, the scientific ignorance of politicians and of science itself on the potential of interactive systems prevents governments from scientifically governing by updating the state of the art in all areas of human activities. Political or world economic choices should be stopped immediately if first men do not learn to design terrestrial anthropogenic plants by closing all the cycles that open, or avoid opening cycles that fail to close, or learn to trigger energy principles and interactive physical purifiers, which are latent but cannot intervene, if those who design the systems do not know how to trigger them, artificially creating centripetal, centrifugal effects and exploiting the principle of impenetrability of the bodies, which expels the primary fluid dynamic energy for free from the pressurized autoclaves. These fluid dynamic effects that nature has always used are due to the movements of water and air and the presence of gravitational force. These beneficial effects in nature occur spontaneously by creating sea currents, artesian wells, moderate ventilation. Is it possible that world science has not noticed that the beneficial effects are becoming evil in recent years? typhoons, droughts and floods are increasing with a logarithmic curve like the acidification of the oceans and the melting of glaciers. What does it take to understand that this damage is produced by the immense amount of thermal and chemical cycles that we have opened and not closed in the soils and in the earth's atmosphere? Luigi Antonio Pezone

The G20s and the COP26,27... cannot understand what science has not yet understood.

Third summary

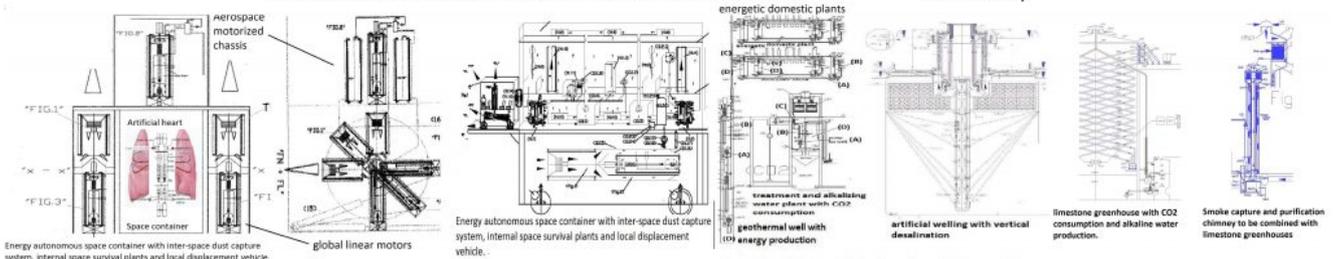

Energy autonomous space container with inter-space dust capture system, internal space survival plants and local displacement vehicle.

Nobody understands the elementary fluid-dynamic logic described in the SPAWHE system (Synergic Plants, Artificial Welling, Hydroelectromagnetic Energy) because it is an interactive logic, between the compressibility of air, the incompressibility of water and the gravitational force, but it occurs in all the great terrestrial atmospheric phenomena and also occurs in the invisible organic and inorganic molecules present on planet earth, which trigger biological processes, of organic and inorganic chemistry. The current terrestrial fluid dynamics inventions have individually exploited the physical principles of liquids creating hydroelectric energy and fluid dynamics and have individually exploited the physical principles of combustion gases and compressed air with a very limited vision of the real potential, both from the point of an energetic and purifying point of view. The interactive principles connected to the laws of Newton, Henry, Pascal, Venturi, Torricelli, who have never worked together to statically exploit the compressible air pressure and the incompressible water circulation, have been dynamically exploited in cylinders with pistons that absorb and return energy with very low yields, while water has been exploited in a single way to produce energy by falling without its recycling. It is obvious that with such a limited vision of world energy science, with the increase in the energy production we need, we would inevitably have produced disastrous environmental side effects by dispersing the water and combustion fumes of the environment. Those who demonstrate in the streets against climate change are right against this science, but they do not realize that they cannot expect a quick solution to problems from this ruling class because the concepts of interactive design have never entered world school education. If they had entered, the first to know them would be the young people protesting in the squares. But if they knew the real cause of the problem it is evident that their professors and science in general would also know about it. Consequently, even the politicians, the economists, the legislators would have adapted. Consequently, global rewilding would not exist. Consequently, they would have no reason to protest. If elementary interactive logic had been taught, everyone would have understood it, just as the wrong concept of perpetual motion was understood. Science has not taught that the concept of perpetual motion would be valid if we lived in a vacuum. But since we live on Earth and gravitational force exists, wrong things have been taught in schools and we have created a wrong development model because we have not been able to design anthropogenic plants by exploiting the fluid dynamic interactive principles that nature has made available to us also to trigger the terrestrial electromagnetic processes, which also function in a vacuum. Although the fluid dynamics principles have been identified by Newton, Henry, Pascal, Venturi, Torricelli, no one has deepened them up to the present day because those who have conquered power and hold the world wealth have also appropriated energy resources and want to consume them even if they do more harm than good to humanity. Unfortunately, those in power also have the power of disinformation and paid silence simply by triggering the fear of job losses, the collapse of world stock exchanges and the loss of apparent social security. Who should explain to the young people who protested outside the G20 and outside COP26, where they managed to enter, that today we are talking about something that is not a utopia, but a reality? They would do so with a model of sustainable work development, which would not produce any kind of pollution, and that we would not have to pay for the energy that is subject to the cost of raw materials, but only the cost of the machines that extract it from environment and maintenance of such machines? Young people cannot believe me who is a simple pensioner. They rightly want the answers from governments and mainstream science. After the world wars of the last century and the collapse of the Berlin Wall on November 9, 1989, the planet Earth should have found world peace and harmony, but the seed of capitalism had already taken root because communism was not accompanied by adequate scientific research. The United Nations did not prove to be up to the task, having concentrated above all on political, economic and humanitarian agreements. Instead, they should have been, above all, a set of impartial scientific and technical bodies, to coordinate world development, safeguard the planet's natural resources, help the poorest countries to keep themselves at the same scientific and technological level as others. After the world wars of the last century and the collapse of the Berlin Wall on November 9, 1989, the planet Earth should have found world peace and harmony, but the seed of capitalism had already taken root because communism was not accompanied by adequate scientific research. The United Nations did not prove to be up to the task, having concentrated above all on political, economic and humanitarian agreements. Instead, they should have been, above all, a set of impartial scientific and technical bodies, to coordinate world development, safeguard the planet's natural resources, help the poorest countries to keep themselves at the same scientific and technological level as others. The United Nations went along with them. The regulations of the WWO, have taxed the ideas of the inventors before they found the economic funds for the experiments, requiring the payment of deposit and maintenance fees in all countries, without making any distinction between inventions of public utility and commercial inventions. The legalized trade in patents studied by public researchers towards multinational was the icing on the cake of a wrong development model that prevented sustainable research in directions those desired by patent buyers. How do world politicians and the United Nations Organization, which manages COPs and WPOs, fail to understand that this system cannot work, indeed, it also encourages public research to work for the profit of multinationals and rewards the worldwide corruption of public bureaucrats, politicians, who hide research and inventions that are not attractive to the only customers who are multinationals. These cannot convert to energies that do not sell or transform raw materials. First they want to amortize all the investments made in the current energies and then they will switch to cleaner energies. Unfortunately, at the point where we are, even clean energies are of little use if they are not sustainable. They cannot be sustainable if they are not interactive. This world science has not yet understood. Luigi Antonio Pezoso

Fourth summary

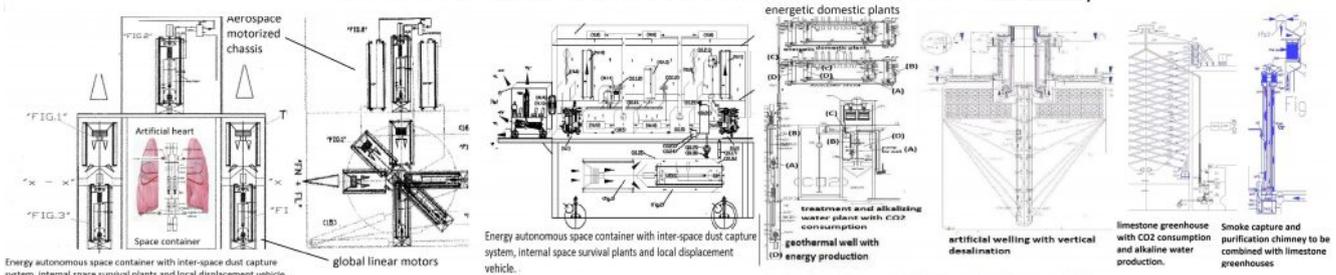

Energy autonomous space container with inter-space dust capture system, internal space survival plants and local displacement vehicle.

The current world centers of power do not want to implement an alternative development model, but only to improve the performance of the current one so that no one can say that politicians and science are not doing their job correctly. In this global context, there is no place for inventors like myself who propose a completely alternative development model to the current world centers of power that cost nothing to world public and private research. If the undersigned had wanted to experiment and realize all SPAWHE's inventions, it would have taken many decades and probably, the wealth of the richest man in the world would not have been enough. Instead, I paid only the taxes on national deposits and international patents on the cleaning of fossil energy (about 20,000 euros) to realize that it is impossible to find public and private interlocutors willing to correct the current development model. Patent trading and international law play out controllers and controls on the same side. At present, the major countries are trying to delay decarbonization and those who want to do it want to switch to other commercial energies, such as nuclear power and hydrogen. However, SPAWHE, developing the details globally, although only virtually, has shown that in order for the earth system to function properly, all human activities must be interactive and self-purifying. It is no coincidence that this system does not transform and does not consume the matter that produces the fixed and mobile terrestrial energy. It only borrows it from nature. In fact, nature has created the gravitational force, the compressible air and the incompressible water that with the machines and systems designed differently from the current way, allow to trigger and maintain over time the self-purifying energy processes in all human activities and means. Land, sea, aeronautical and space transport. Even the human heart can be replaced with very small self-purifying systems that are autonomous energetically, which could be the first step to extend the duration of human life, not by months or a few years, but by multiplying the current duration, if yes, it accepts coexistence with prostheses and artificial intelligence. We have seen through the Paralympics that you can be happy and efficient even with severe disabilities if you love life and believe in moral values. I consider myself a lucky person because I loved my work which stimulated me to grow in knowledge, even if I only collected silences. My work as a designer and installer of industrial and environmental anthropic systems has never allowed me to design a complete system. I had to do it as a retiree, at least virtually, because my implants were never built, as they are also misunderstood by science. As an employee I was bound by company directives and public tender specifications, which had already identified the solutions to be implemented, the type of machines to be used. Basically, in the last twenty years my job consisted of competing with competing companies, first to win the job and then I developed it in detail and make it happen. I had to do a market research to win tenders between different suppliers to identify the machines that met the specifications, estimate the costs of the construction and assembly of the complete plant with all the materials, accessories and completion equipment. Obviously, not alone, being solely responsible for the hydraulic, mechanical and process control instrumentation systems. Once I got the job, my job was to develop the executive details, buy the machines and equipment, and try to get back into the budget costs. It is clear that this type of work carried out in industrial and environmental plant engineering does not leave room for imagination and creativity, but allows you to know the details of the machines, work cycles, work organization, and to identify defects and limitations of plants normally contracted out, above all, by world public bodies. These plants, not being constrained like those of industrial production (which I had known in the previous twenty years), do not update the production machines according to the organization of work to win the competition on the quantity and quality of the product. Therefore, the state of the art of industrial production machines advances at a much faster rate than the state of the art of environmental protection and primary energy production. I think my industrial experience was fundamental to realize the difference. Probably, if I had not added the two experiences, I would not have been able to propose myself as a retired inventor. In fact, the production of energy is closely linked to the advancement of the state of the art of environmental protection. But it is impossible to improve the state of the art of energy production without going into all the details of the environmental systems and without applying the rules of the organization of industrial work to increase energy and purification productivity at the same time. The first step was to unify the water and air purification cycles and this automatically involved changing the chimney stacks, sewage systems and purification plants. All subsequent plant improvements could only come about after taking the first step that the world ruling class never had the courage to take. This is why I was forced to create a website where the inventions and related illustrative publications are published in chronological order so that everyone can understand at least the advancement of the virtual state of the art, since the real one never happened. So, I am forced to publish the SPAWHE.eu nursery rhyme again, to challenge public science and that of multinationals to go into details as I did, despite not having public and private funds and experimental laboratories available. It must be public and private science that takes responsibility for denying the validity of my solutions, not the bureaucrats of the patent offices, nor even the politicians who direct the ministries of the environment, economic development and world labor. Only by reading SPAWHE's nursery rhyme which is a long list of inventions not tested unanimously can we realize that science does not work for all of humanity but

Fifth summary

Energy autonomous space container with inter-space dust capture system, internal space survival plants and local displacement vehicle.

It seems that science is behaving like politics, not revealing its findings quickly to avoid the collapse of the world stock exchanges. In this timing strategy, probably, the silences can also be framed on the SPAWHE rhyme. But this strategy can no longer be pursued. Science has a duty to speak out immediately because if science continues not to be applied globally, all investments for future development will continue to be wrong. Already today the bulk of future investments will be due to the demolition of the wrong inventions. Especially the gigantic structural, hydraulic, nuclear, thermal works, those that transport gas and oil, those that transport electricity. The whole, current world development has become obsolete. If it does not stop immediately and becomes positively interactive with the terrestrial environment, science will be the most responsible for the complete destruction of the terrestrial biological, zoological, aquatic balances which are fundamentally based on the interactivity of primary fluid dynamics with electromagnetism at terrestrial temperature. While the equilibria of the universe are based on the interactivity of the thermodynamic primary energy with the same electromagnetism. To save the planet and begin the colonization of the universe we cannot wait for the long times of science that continues to work in watertight compartments, while politicians and economists, clearly, not knowing what to do, continue to spend resources by financing development and works, obsolete. Here is again SPAWHE's rhyme: "The cleaning of fossil energy published in spanish, based, above all on inorganic chemistry that is able to absorb CO2, producing carbonates in the water. To speed up the processes and reduce the energy costs that would have involved the circulation of very large quantities of water necessary to neutralize the very large quantities of CO2 emitted by the current thermal power plants and heat engines, it has gradually been transformed technologically into solutions of less space by exploiting the principles Pascal and Henry. In fact, I realized that on planet Earth, all the activities that nature produces through organic and inorganic chemistry, photosynthesis and the carbon cycle can be increased in speed without any need to use thermal, nuclear energy and current renewables. It is sufficient only to increase the operating pressures of the systems, modify the circulation pumps and make the machines work differently. In fact, natural interactive systems exist, with the times required by nature, the elements extraneous to natural cycles, due to accidental polluting phenomena, including direct and indirect thermal effects due to volcanic eruptions, to natural fires that have always existed on the planet. The current industrial activities of man have multiplied exponentially the elements extraneous to natural cycles, therefore nature is no longer able to restore interactive balances. Obviously, this is my truth and in the entire website, I explain how, in my opinion, we should have created global plants that purify both fumes and water at the same time before they go to pollute the soils, rivers, lakes and seas. Having not done this in any country in the world, it has not been possible to advance the state of the art of purification to make it known to other countries. Therefore, the advancement of the state of the global purification art has not occurred. Consequently, it was not even possible to notice that the water circulation pumps, if we make them work in the direction of gravitational force, by placing them in series with the turbines, we could extract the energy directly from the environment. Having not done this, it was not possible to realize that the water circulation pumps, if in addition to making them pump in the direction of gravitational force, we modify them on the suction side and make them another inlet clearly separated from the main one up to the same impeller, we can always use the same water to create energy because we use one feed to recycle the water from the upper basin and the other feed to introduce into the same impeller the water discharged from a turbine fed by falling water from the same upper basin. Not having done this, it was not possible to think that by replacing the upper basin with a pressurized autoclave with compressed air, it being understood that we use a turbine connected to the outlet of the autoclave, we can recover the water drained from the turbine and insert it back into the autoclave, whose pressurized water is recycled with the same impeller of the pump by means of the second supply. In this way, with the same water and the same compressed air, we would have produced a current generator that extracts energy from the environment, with quite small dimensions. Having not done this, it was not possible to further reduce the dimensions of this current generator by increasing the operating pressure of the autoclave in order to be able to mount it on cars and trucks, on agricultural tractors. Not having done this, it was not possible to think that the overall dimensions can still be reduced by using submersible pumps as turbines mounted directly in cylindrical tubes that would act as autoclaves. Therefore, these groups could be used to be inserted directly into the wells to raise the water and at the same time oxygenate the aquifers which today are polluted by agricultural fertilizers, herbicides and pesticides and fecal coliforms. In fact, we know that part of the air that pressurizes the autoclave dissolves in the water according to Henry's principle, purifying the water for free. Not having done this, it was not possible to think that the overall dimensions could be reduced even further. Even miniaturized and instead of purifying the water from the wells we could purify the human blood, placing two small autoclaves side by side that would replace the right and left ventricles, creating energetically autonomous artificial hearts that would feed the systemic circuit that oxygenates the brain and the lungs to lengthen the life of the man. Having not done this, it was not possible to think that pressurized cylindrical autoclaves can be incorporated as external cylinders containing water at atmospheric pressure, outside of the tank in which sliding tanks of permanent magnets mounted on transmission chains driven by motors can be made electric, at variable revolutions, that would produce an electromagnetic flux of variable intensity which would produce induced currents in a solenoid outside the same water tank. Therefore, we could produce in this tank a linear electromagnetic thrust force according to Lorentz's law at the ambient temperature, without fuel that could be added to the reaction thrust of Newton that would be produced by propellers driven by electric motors always commanded by generators, of current that produce the primary hydroelectric energy, fed by submersible pumps used as turbines placed inside the central reservoirs. Not having done this, it was not possible to realize the current thermal turbines of aircraft to travel in the atmosphere and in space with energy extracted directly from the environment. It was not possible to create flying cars, nor submarines that move with the same system without fuel. It was not possible to make the ships travel without fuel, nor to mount the same system to make mobile barriers in the sea to defend ourselves from high waters. It was not even possible to think that in the space travel of the future we can add to the global motor an external steel tunnel connected to the turbine fan, when it will produce a higher vacuum higher than the surrounding space vacuum and connect this tunnel to a thickening tank of the captured powders, which will be emptied periodically letting in the atmospheric air which will create an electrostatic filter that will recover the powders that will be used together with the other interactive purification and energy plant inventions described on the website https://www.spawhe.eu to make humans survive even in space without suffering physiological damage due to the absence of atmospheric pressure, gravity, food resources and very similar to build spare parts for the machines necessary for survival in space. In fact, atmospheric air and water will fill the space container and will be endlessly recycled, suitably replenished with artificial photosynthesis and carbon cycle, while general gravity will be reinforced, becoming very similar to the terrestrial one, electrostatically polarizing the paths of atmospheric conditioned air and recycled water in the interactive, energy and purification, compressed hydroelectromagnetic plants, not unknown to terrestrial science." Luigi Antonio Pezoso
